# STROKE PREDICTION

#### Small Introduction:

The project aims to predict heart stroke prediction using machine learning with the help of some health vitals of patients.

#### Introduction:

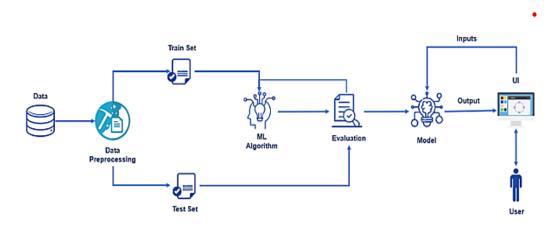

According to the World Health Organization (WHO) stroke is the 2nd leading cause of death globally, responsible for approximately 11% of total deaths.

This dataset is used to predict whether a patient is likely to get a stroke based on the input parameters like gender, age, various diseases, and smoking status.

Each row in the data provides relevant information about the patient.

Here we will be building a flask application that uses a machine learning model to get the prediction of heart stroke.

#### Architecture:

### **Project Objectives:**

By the end of this project:

- You'll be able to understand the problem to classify if it is a regression or a classification kind of problem.
- You will be able to know how to pre-process/clean the data using different data preprocessing techniques.
- How to perform oversampling when the dataset is imbalanced.
- Applying different algorithms according to the dataset
- You will be able to know how to find the accuracy of the model.

• You will be able to build web applications using the Flask framework.

#### Project Flow:

- Download the dataset.
- Preprocess or clean the data.
- Identify Outliers and remove Outliers
- Analyze the pre-processed data.
- Perform Oversampling
- Train the machine with preprocessed data using an appropriate machine learning algorithm.
- Save the model and its dependencies.
- Build a Web application using a flask that integrates with the model built.

#### Pre-requisites:

1. In order to develop this project we need to install the following software/packages:

#### Anaconda Navigator:

Anaconda Navigator is a free and open-source distribution of the Python and R programming languages for data science and machine learning related applications. It can be installed on Windows, Linux, and macOS.Conda is an open-source, crossplatform, package management system. Anaconda comes with so very nice tools like JupyterLab, Jupyter Notebook, QtConsole, Spyder, Glueviz, Orange, Rstudio, Visual Studio Code. For this project, we will be using Jupyter notebook and Spyder

#### Python packages:

#### NumPy:

NumPy is a Python package that stands for 'Numerical Python'. It is the core library for scientific computing, which contains a powerful n-dimensional array object.

#### Pandas:

pandas is a fast, powerful, flexible, and easy to use open-source data analysis and manipulation tool, built on top of the Python programming language.

#### Matplotlib:

It provides an object-oriented API for embedding plots into applications using generalpurpose GUI toolkits Scikit-learn: It is a free machine learning library for Python. It features various algorithms like support vector machine, random forests, and kneighbours, and it also supports python numerical and scientific libraries like NumPy and SciPy.

Flask: Web framework used for building Web applications

- Stroke Prediction.ipynb is the jupyter notebook file where the model is built.
- Dataset.zip is the dataset file used in this project.
- model is the model file that generates when the notebook file is executed.

- Column,mar\_transform,res\_transform are the transformation and encoding files that were generated when u run the main program.
- Flask folder is the application folder where the web application and server-side program are present.
- healthcare-dataset-stroke-data.csv is the dataset file

#### Milestone1:

Data Collection For any Machine learning project data is the primary source

#### Attribute Information

- 1) id: a unique identifier
- 2) gender: "Male", "Female" or "Other"
- 3) age: age of the patient
- 4) hypertension: 0 if the patient doesn't have hypertension, 1 if the patient has hypertension
- 5) heart\_disease: 0 if the patient doesn't have any heart diseases, 1 if the patient has a heart disease
- 6) ever\_married: "No" or "Yes"
- 7) work\_type: "children", "Govt\_jov", "Never\_worked", "Private" or "Self-employed"
- 8) Residence\_type: "Rural" or "Urban"
- 9) avg\_glucose\_level: average glucose level in the blood
- 10) BMI: body mass index
- 11) smoking\_status: "formerly smoked", "never smoked", "smokes" or "Unknown"\*
- 12) stroke: 1 if the patient had a stroke or 0 if not \*Note: "Unknown" in smoking\_status means that the information is unavailable for this patient

#### Milestone 2:

Pre-process the data In this milestone, we will be preprocessing the dataset that is collected. Preprocessing includes:

- 1. Handling the null values.
- 2. Handling the categorical values if any.
- 3. Removing Outliers
- 4. Oversampling to balance the data.
- 5. Identify the dependent and independent variables.
- 6. Split the dataset into train and test sets.

#### Activity 1:

Import required libraries Go to the project folder which you have created copy the project path and open anaconda prompt from the menu and go to the location of your project folder in anaconda prompt and type jupyter notebook. Now Jupyter notebook will be opened and create a python file and start the programming.

                                                   int64
                                                   object
          6 work_type
                                  5110 non-null
          7 Residence_type
                                  5110 non-null
                                                   object
          8 avg_glucose_level 5110 non-null
                                                   float64
                                  4909 non-null
                                                   float64
          10 smoking_status
11 stroke
                                  5110 non-null
5110 non-null
                                                  int64
         dtypes: float64(3), int64(4), object(5)
         memory usage: 479.2+ KB
```

There are total of 5110 records in the dataset with a total of 12 features.

## Activity 3:

Check Null values Here we check the presence of Null values in the dataset and dropping the null values.

```
In [54]: df.dropna(inplace = True)
In [55]: df.isnull().sum()
Out[55]: id
                                      0
            gender
            age
            hypertension
           heart_disease
           ever_married
work_type
            Residence_type
           avg_glucose_level
bmi
            smoking_status
           stroke
dtype: int64
In [56]: for i in ['gender', 'ever_married', 'work_type', 'Residence_type', 'smoking_status']:
    print(df[i].unique())
            ['Male' 'Female' 'Other']
['Yes' 'No']
['Private' 'Self-employed' 'Govt_job' 'children' 'Never_worked']
['Urban' 'Rural']
            ['formerly smoked' 'never smoked' 'smokes' 'Unknown']
```

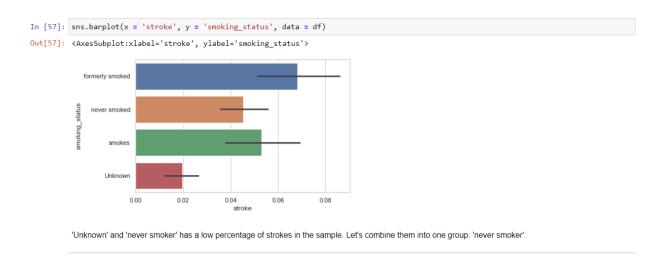

#### Milestone 3:

# **Exploratory Data Analysis**

Exploratory data analysis is an approach to analyzing data sets to summarize their main characteristics, often using statistical graphics and other data visualization methods.

## Activity1:

## **Plotting Boxplot**

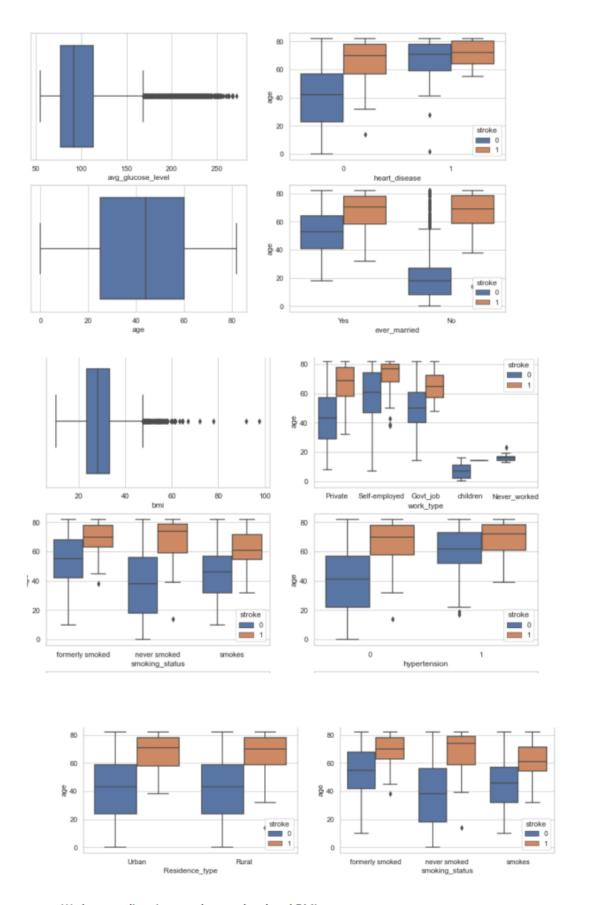

'Unknown' and 'never smoker' has a low percentage of strokes in the sample. Let's combine them into one group: 'never smoker'.

```
In [58]: replace_values = {'Unknown': 'never smoked'}

df = df.replace({'smoking_status': replace_values})
    df.head()
```

t[58]:												
	id	gender	age	hypertension	heart_disease	ever_married	work_type	Residence_type	avg_glucose_level	bmi	smoking_status	stroke
	0 9046	Male	67.0	0	1	Yes	Private	Urban	228.69	36.6	formerly smoked	1
	<b>2</b> 31112	Male	80.0	0	1	Yes	Private	Rural	105.92	32.5	never smoked	1
	<b>3</b> 60182	Female	49.0	0	0	Yes	Private	Urban	171.23	34.4	smokes	1
	4 1665	Female	79.0	1	0	Yes	Self-employed	Rural	174.12	24.0	never smoked	1
	<b>5</b> 56669	Male	81.0	0	0	Yes	Private	Urban	186.21	29.0	formerly smoked	1

```
In [59]: fig, axes = plt.subplots(nrows = 5, ncols = 2, figsize = (12, 20))
sns.boxplot(x = 'avg_glucose_level', data = df, ax=axes[0][0])
sns.boxplot(x = 'age', data = df, ax=axes[1][0])
sns.boxplot(x = 'bmi', data = df, ax=axes[2][0])
sns.boxplot(x = 'smoking_status', y = 'age', hue = 'stroke', data = df, ax=axes[3][0])
sns.boxplot(x = 'hypertension',y = 'age', hue = 'stroke', data = df, ax=axes[3][1])
sns.boxplot(x = 'heart_disease', y= 'age', hue = 'stroke', data = df, ax=axes[0][1])
sns.boxplot(x = 'ever_married',y = 'age', hue = 'stroke', data = df, ax = axes[1][1])
sns.boxplot(x = 'work_type',y = 'age',hue = 'stroke', data = df, ax = axes[2][1])
sns.boxplot(x = 'Residence_type',y = 'age',hue = 'stroke', data = df, ax = axes[4][0])
sns.boxplot(x = 'smoking_status',y = 'age', hue = 'stroke', data = df, ax = axes[4][1])
```

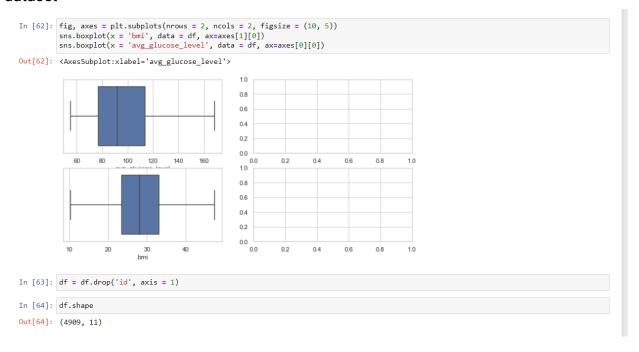

We have outliers in avg\_glucose\_level and BMI.

# Activity3:

## **Removing Outliers**

```
In [60]: ### Thanks for the function https://www.kaggle.com/ankitak46
           def remove_outliers(data):
               arr=[]
                #print(max(list(data)))
                q1=np.percentile(data,25)
               q3=np.percentile(data,75)
iqr=q3-q1
               mi=q1-(1.5*iqr)
               ma=q3+(1.5*iqr)
               #print(mi,ma)
for i in list(data):
                    if i<mi:</pre>
                        i=mi
                    arr.append(i)
elif i>ma:
                        i=ma
                         arr.append(i)
               arr.append(i)
#print(max(arr))
               return arr
In [61]: df['bmi'] = remove_outliers(df['bmi'])
          df['avg_glucose_level'] = remove_outliers(df['avg_glucose_level'])
print('Outliers successfully removed')
           Outliers successfully removed
```

# Checking whether the outliers are removed or not and dropping ID column from the dataset

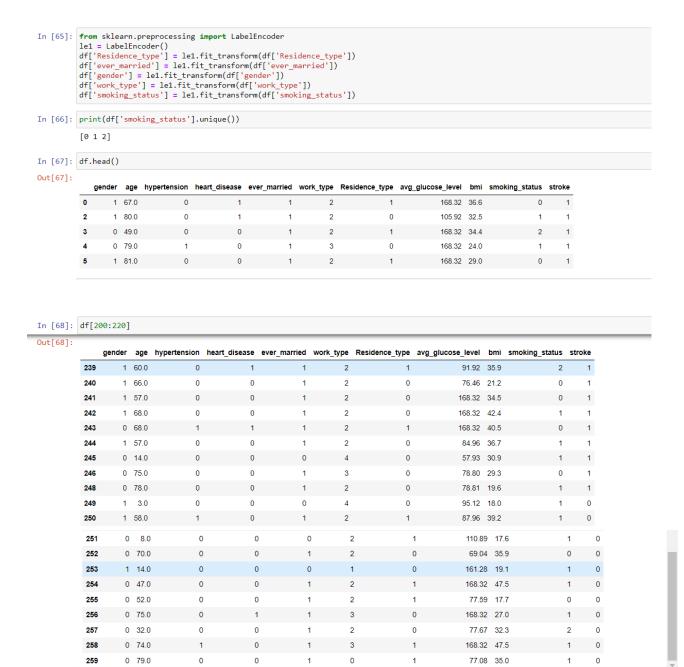

#### Milestone4:

Processing Categorical Data In machine learning, we usually deal with datasets that contain multiple labels in one or more than one columns. These labels can be in the form of words or numbers. To make the data understandable or in human-readable form, the training data is often labelled in words.

#### Activity1:

Label Encoding on Categorical Variables Label Encoding refers to converting the labels into the numeric form so as to convert them into the machine-readable f

```
In [69]: import joblib
        joblib.dump(le1,"transform")

#### Milestone 5:

Model Building We will be using the features to build the model by splitting them into dependent and independent variables and balance the dataset using oversampling

#### Activity1:

Perform Oversampling Imbalanced datasets are those where there is a severe skew in the class distribution, such as 1:100 or 1:1000 examples in the minority class to the majority class. This bias in the training dataset can influence many machine learning algorithms, leading some to ignore the minority class entirely. This is a problem as it is typically the minority class on which predictions are most important. One approach to addressing the problem of class imbalance is to randomly resample the training dataset. The two main approaches to randomly resampling an imbalanced dataset are to delete examples from the majority class, called undersampling, and to duplicate examples from the minority class, called oversampling.

```
In [75]: X.shape
Out[75]: (4909, 10)
In [76]: y.shape
Out[76]: (4909,)
```

#### We use sampling because there is an imbalance of the target feature

```
In [77]: ### before oversampling

         print('----')
```

#### Milestone 6:

Application Building After the model is built, we will be integrating it into a web application

#### Activity 1:

Build the python flask app In the flask application, the user values are taken from the HTML page.

```
1 from flask import Flask, request, render_template
   2 import joblib
   3 import numpy as np
   4 app = Flask(__name__)
   5 model = joblib.load("model")
   6 label1 = joblib.load("mar_transform")
   7 label2 = joblib.load("res_transform")
   8 column = joblib.load("column")
  10 app = Flask(__name__)
 11
Load the home page
12 @app.route('/')
13 def predict():
        return render_template('Manual_predict.html')
Prediction function
  16 @app.route('/y_predict',methods=['POST'])
  17 def y_predict():
        x_test = [[(x) for x in request.form.values()]]
  19
        print('actual',x_test)
        x_test=np.array(x_test)
        x_test[:,4]=label1.transform(x_test[:,4])
        x_test[:,6]=label2.transform(x_test[:,6])
        x_test=column.transform(x_test)
        pred = model.predict(x_test)
  25
        print(pred)
  26
        if(pred[0]==0):
  27
             result="no chances of stroke"
  28
         else:result="chances of stroke"
  30
         return render_template('Manual_predict.html', \
  31
                                prediction_text=('There are \
  32
                                                   ',result))
```

#### Activity 2:

Build an HTML Page We Build an HTML page to take the values from the user in a form and upon clicking on the predict button we get the prediction

```
1 <html>
 2 <head>
